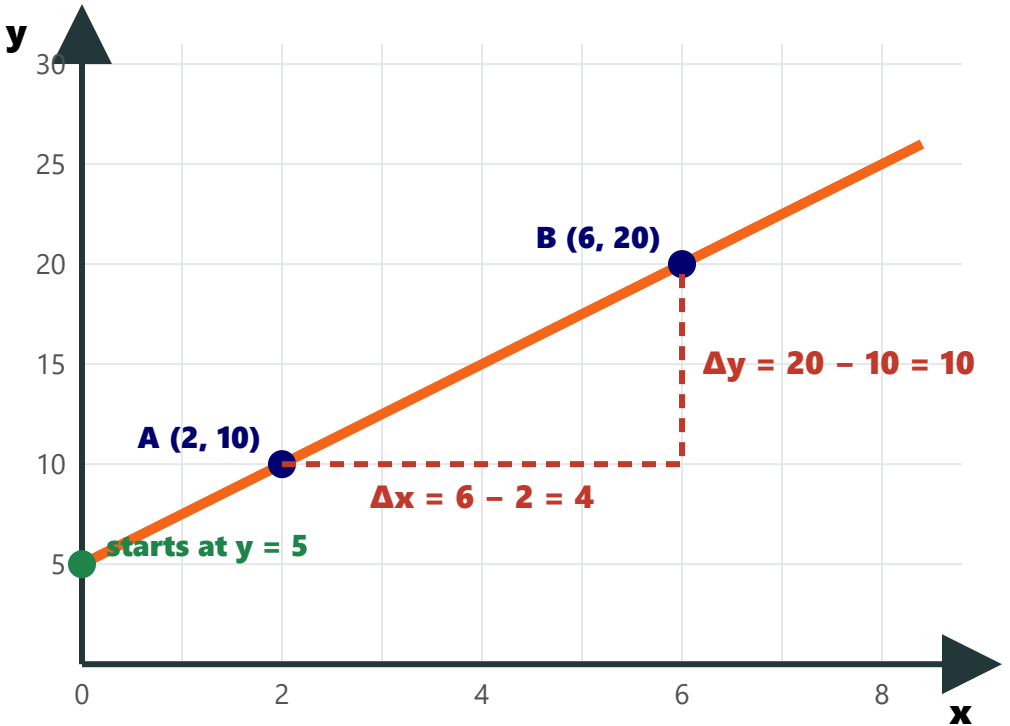
Analysing a straight-line graph



1. Where does it start? At x = 0 the line is at y = **5** (if it starts at 0, it passes through the origin).

2. Does it go up or down? It goes **up**: when x increases, y increases.

3. How steep is it? The slope

$$\text{slope} = \frac{\Delta y}{\Delta x} = \frac{y_B - y_A}{x_B - x_A} = \frac{10}{4} = \mathbf{2{,}5}$$

For each unit of x, y increases 2,5.

goes up: positive slope

goes down: negative slope

horizontal: slope 0 (y does not change)

steeper = bigger slope
