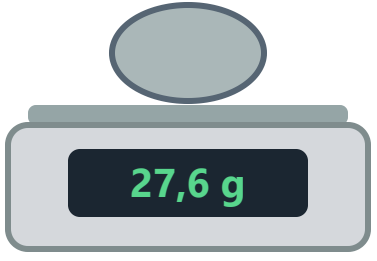
Medida de la densidad de un sólido (desplazamiento de agua)

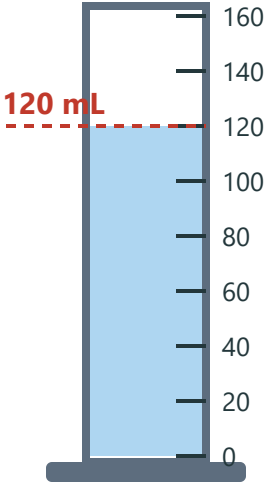
1



Pesa el sólido

m = 27,6 g

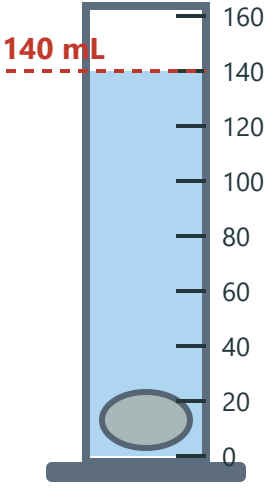
2



Agua en una probeta

V_1 = 120 mL

3



Echa el sólido: el agua sube

V_2 = 140 mL

4

$V = V_2 - V_1 = 140 - 120 =$ **20 mL**

$$d = \frac{m}{V} = \frac{27{,}6\ g}{20\ mL}$$

d = 1,38 g/mL
