Measuring an irregular surface by weighing

1

Weigh a **known** square: S_M = 1 dm², M_M = 20.8 g

2

Cut out the irregular shape from the **same paper** and weigh it: M_F = 8.3 g

3

$$S_F = S_M \cdot \frac{M_F}{M_M}$$

$$S_F = 1\ \text{dm}^2 \cdot \frac{8.3\ \text{g}}{20.8\ \text{g}}$$

$$S_F = 0.40\ \text{dm}^2$$

Twice the mass ⇒ twice the surface (rule of three).
