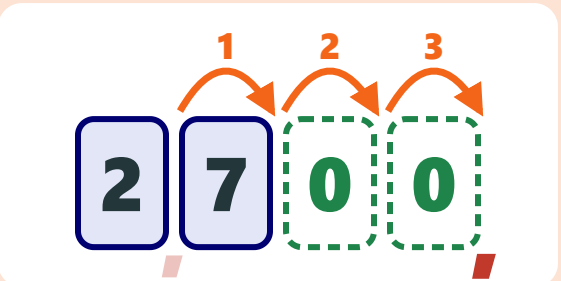
From scientific notation to decimal: the exponent tells you the jumps

Positive exponent

$2{,}7 \cdot 10^{3}$

+3 → 3 jumps to the **RIGHT** (the number gets bigger)



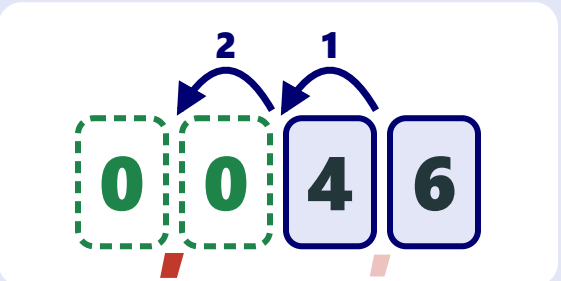
→ **2700**

bigger than 1

Negative exponent

$4{,}6 \cdot 10^{-2}$

−2 → 2 jumps to the **LEFT** (the number gets smaller)



→ **0,046**

smaller than 1

0 = a zero we add when there are no more digits to jump over.
