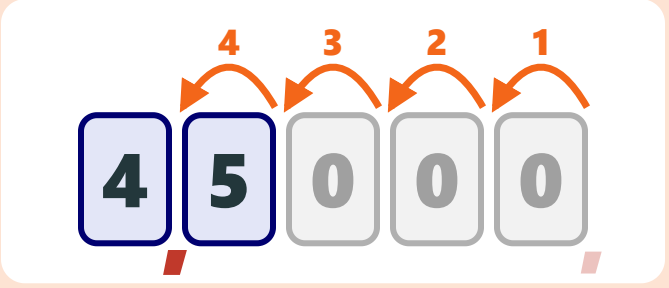
From decimal to scientific notation: count the jumps of the comma

Number ≥ 10

45 000

The comma is hidden at the end: 45 000,



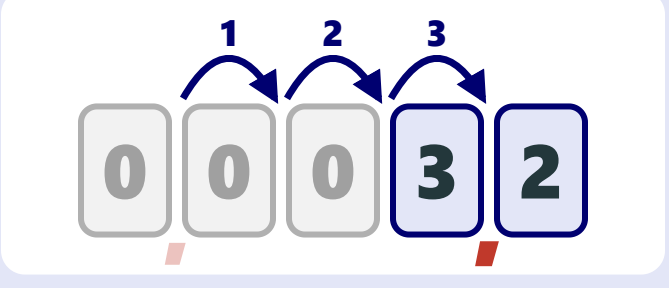
→ $4{,}5 \cdot 10^{4}$

4 jumps to the **LEFT**
→ exponent **+4**

Number < 1

0,0032

The zeros in front of the 3 disappear.



→ $3{,}2 \cdot 10^{-3}$

3 jumps to the **RIGHT**
→ exponent **−3**

Move the comma until **only one digit (not zero)** is left in front of it. **Number of jumps = exponent.**
