The scientific method

1

Observation

We notice something and ask a question.

2

Hypothesis

A possible explanation we can test.

3

Experiment

Change ONE variable and measure.

4

Analysis

Organise data in tables and graphs.

5

Conclusion

Accept or reject the hypothesis.

✗ Hypothesis rejected? Propose a new one and test it again!

Finally, scientists **communicate** their results using scientific language and SI units.
