Kinetic theory explains everyday life

Diffusion

The smell of perfume spreads through the whole room.

Gas particles move freely and mix with the air.

Compressibility

We can squeeze the air in a closed syringe, but not water.

Gas particles have lots of empty space between them.

Thermal expansion

Railway tracks and bridges have small gaps between sections.

When heated, particles vibrate more and move slightly apart.

Pressure and temperature

Aerosol cans must never be heated: they can explode.

Hot gas particles hit the walls faster and harder.
