Two temperature scales: Celsius and Kelvin

To change from °C to K:

T(K) = T(°C) + 273

🌡️ 20 °C → 20 + 273 = **293 K**

🧊 −10 °C → −10 + 273 = **263 K**

⚠ In the gas laws, temperature must ALWAYS be in kelvin.

0 K (−273 °C) is the **absolute zero**: the coldest possible temperature, where particles stop moving.
