Plasma: the fourth state of matter

The Sun
a huge ball of plasma

Stars
all of them are plasma

Lightning
plasma for a fraction of a second

Auroras
northern and southern lights

Neon signs
and fluorescent tubes

In the Universe

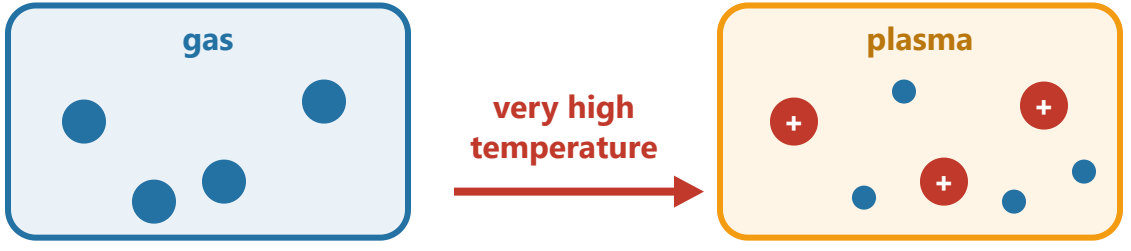

plasma ≈ 99 % of visible matter

Plasma is the **most abundant** state in the Universe.

On the Earth

plasma is very rare

Here almost everything is **solid, liquid or gas**.

A plasma is a gas so **hot** that its particles break and become **electrically charged**. That is why it glows and conducts electricity.
