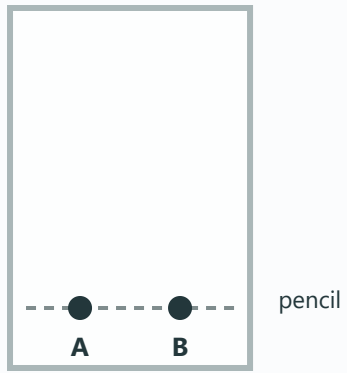
How to separate by chromatography

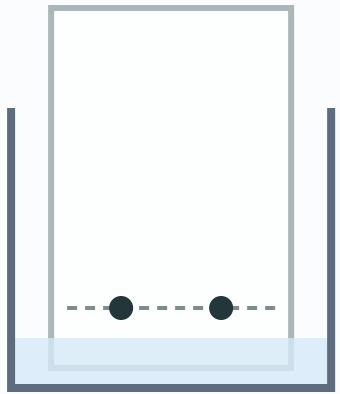
Mixture: inks or food dyes · **Property used:** how far each substance is **carried** by the solvent along the paper

1



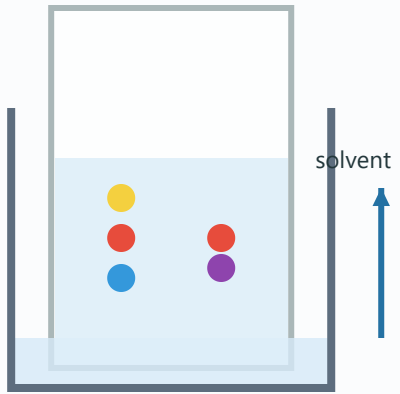
Draw a **pencil** line on the paper and put a small dot of each ink on it.

2



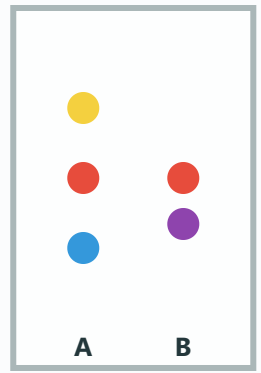
Dip the bottom of the paper in the **solvent** (water or alcohol). The dots must be **above** it.

3



The solvent **rises** up the paper and carries each dye a **different** distance.

4



Let it dry: each **spot** is a different substance. Same height = same substance.
