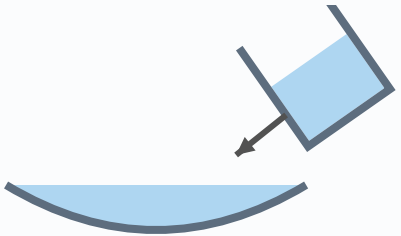
How to separate by evaporation and crystallisation

Mixture: salt dissolved in water · **Property used:** the **boiling point**: the water evaporates, the salt does not

1



evaporating dish

Pour the salt water into an **evaporating dish**.

2

Heat it gently (or leave it in a sunny place): the water **evaporates**.

3

✓ salt crystals

✗ the water is lost

The **salt crystals** remain in the dish. Slow evaporation gives bigger crystals.
