Worked example 2: muddy, oily water (sand + oil + water)

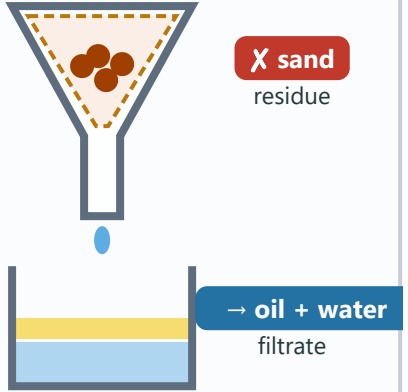

Mixture: sand, oil and water · **Goal:** to obtain **clean water**

1

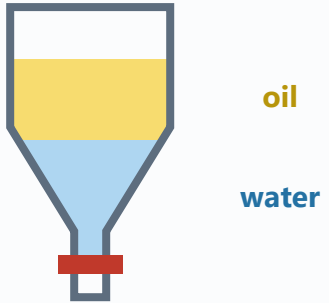

The mixture has **three** components: a solid and two liquids that do not mix.

2

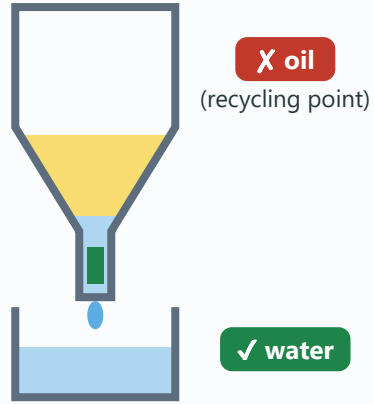

Filtration first: the sand stays on the paper. We do not need it.

3

Pour the filtrate into a **separating funnel** and wait: two layers form.

4

Decantation: the water comes out through the tap. The oil goes to a recycling point.

✓ **KEEP** what we want to obtain → **NEXT** goes on to the next step ✗ **DISCARD** we do not need it
