Properties of energy

It is transferred

from one body to another

the cooker heats the pan

It can be stored

to be used later

batteries, fuels, a wound spring

It is transported

from one place to another

electricity in cables, sunlight through space

It is transformed

from one form into another

a wind turbine: kinetic → electrical

It is degraded

part always ends up as useless heat

a bulb gets hot: wasted energy

It is conserved

it is never created or destroyed

total energy before = total energy after
