Forms of energy

Kinetic

a body has it because it MOVES; more mass and more speed → more energy

e.g. a moving car

Gravitational potential

because of its HEIGHT; more mass and more height → more energy

e.g. a roller coaster at the top

Elastic potential

stored in something stretched or squashed

e.g. a bow, a spring

Thermal

movement of the particles inside a body; related to temperature

e.g. a hot cup of tea

Electrical

electric charges in motion (electric current)

e.g. a phone charging

Radiant

carried by light and other waves (radio, microwaves, X-rays)

e.g. sunlight

Chemical

stored in the bonds between atoms; released in reactions

e.g. food, fuels, batteries

Nuclear

stored in the nucleus of atoms

e.g. the Sun, nuclear power stations

Mechanical energy = kinetic energy + potential energy
