How does a wind turbine work?

1. The wind has **kinetic energy**.
2. It pushes the blades, which turn: **mechanical energy**.
3. The rotating shaft moves a **generator**.
4. The generator produces **electrical energy** ⚡.

📍 **Castilla-La Mancha** is one of the Spanish regions that produce the most wind energy, thanks to its flat land and steady winds. It produces no CO_2, but wind farms change the landscape and can affect birds.
