Prefixes: numbers said with words

The prefix tells how many atoms there are. It is joined to the name: **tri**oxide, **di**iron

1	2	3	4	5
mono	di	tri	tetra	penta

6	7	8	9	10
hexa	hepta	octa	nona	deca

No prefix = 1 atom.
NaCl → sodium chloride (not "monosodium monochloride").

mono is only used to tell two similar compounds apart:
CO carbon **mon**oxide · CO_2 carbon **di**oxide.
